

Voice control for adjustable beds

Interest in voice control for adjustable beds continues to grow, and for good reason. Below we have listed **5 benefits of voice control for adjustable beds** to make it easier for you to choose the most suitable system.

1. Hands-free control

With both online and offline solutions, the user can adjust their bed positions without any manual interaction. This adds convenience and ease to the user going to bed after a long day.

Online solutions allow for integration with e.g. Google Assistant™ or Amazon Alexa and can expand the hands-free control possibilities to add a touch of luxury to the relaxing and sleeping experience. With supported devices, the user can further adjust the lighting or turn on their favourite music.

2. Home automation

An online voice control solution integrates easily into a home automation system. If supported by the user's devices, they can add smart routines to be triggered by voice commands or at set times of the day.

A simple "Good morning" or the clock hitting 06:00 AM can make the curtains go up, adjust the bed to a preferred position, turn on the lights, some light music and maybe even the coffee machine.

An offline voice control solution does not support smart routines..

3. Voice recognition

Offline voice control solutions only support a limited number of voice commands and might not respond to all commands. Online solutions are automatically updated with new and enhanced voice commands, languages and dialects making the voice control more accurate.

4. Always up-to-date

The online voice control solution can easily be integrated into an existing home automation system. The users will automatically receive security updates, new smart features, new voice commands and improvements. Offline voice control solutions remain available in the event of internet outages and connectivity issues, but they are not updated.

5. Privacy

Online voice control solutions require the collection and storage of voice data to be able to recognise your voice and dialect. Users can rest assured that our bed adjustment systems and compatible voice control assistants have been developed to keep data safe. Offline solutions do not require the collection or storage of voice data, as all information is kept only in the system.

Online versus offline

Online versus offline

Voice-controlled adjustable beds can add a touch of automation and convenience to the user's relaxing experience. Online voice control solutions offer a high degree of accuracy and enhanced features. Offline solutions have limited functionalities, are less accurate, but fully functional in case of internet outages.

Ultimately, the choice between online and offline voice control solutions comes down to personal preferences. Regardless of the choice, voice control offers a new level of luxury and comfort to users of adjustable beds.

	Online	Offline
Hands-free control	Yes	Yes
Home automation	Yes	No
Voice recognition	High accuracy and update of voice commands.	Lower accuracy and limited number of voice commands
Always up-to-date	Yes	No
Privacy	Collection and storage of data	No collection and storage of data
